

Module 1: Cloud Computing

Agenda

- * What is Cloud Computing ?**
- * Why Cloud Computing ?**
- * On - Premises v/s Service models**
- * Advantages & Disadvantages of cloud computing**
- * Capacity v/s Usage**
- * Cloud v/s Virtualization**
- * What's the difference**
- * Cloud computing Providers**

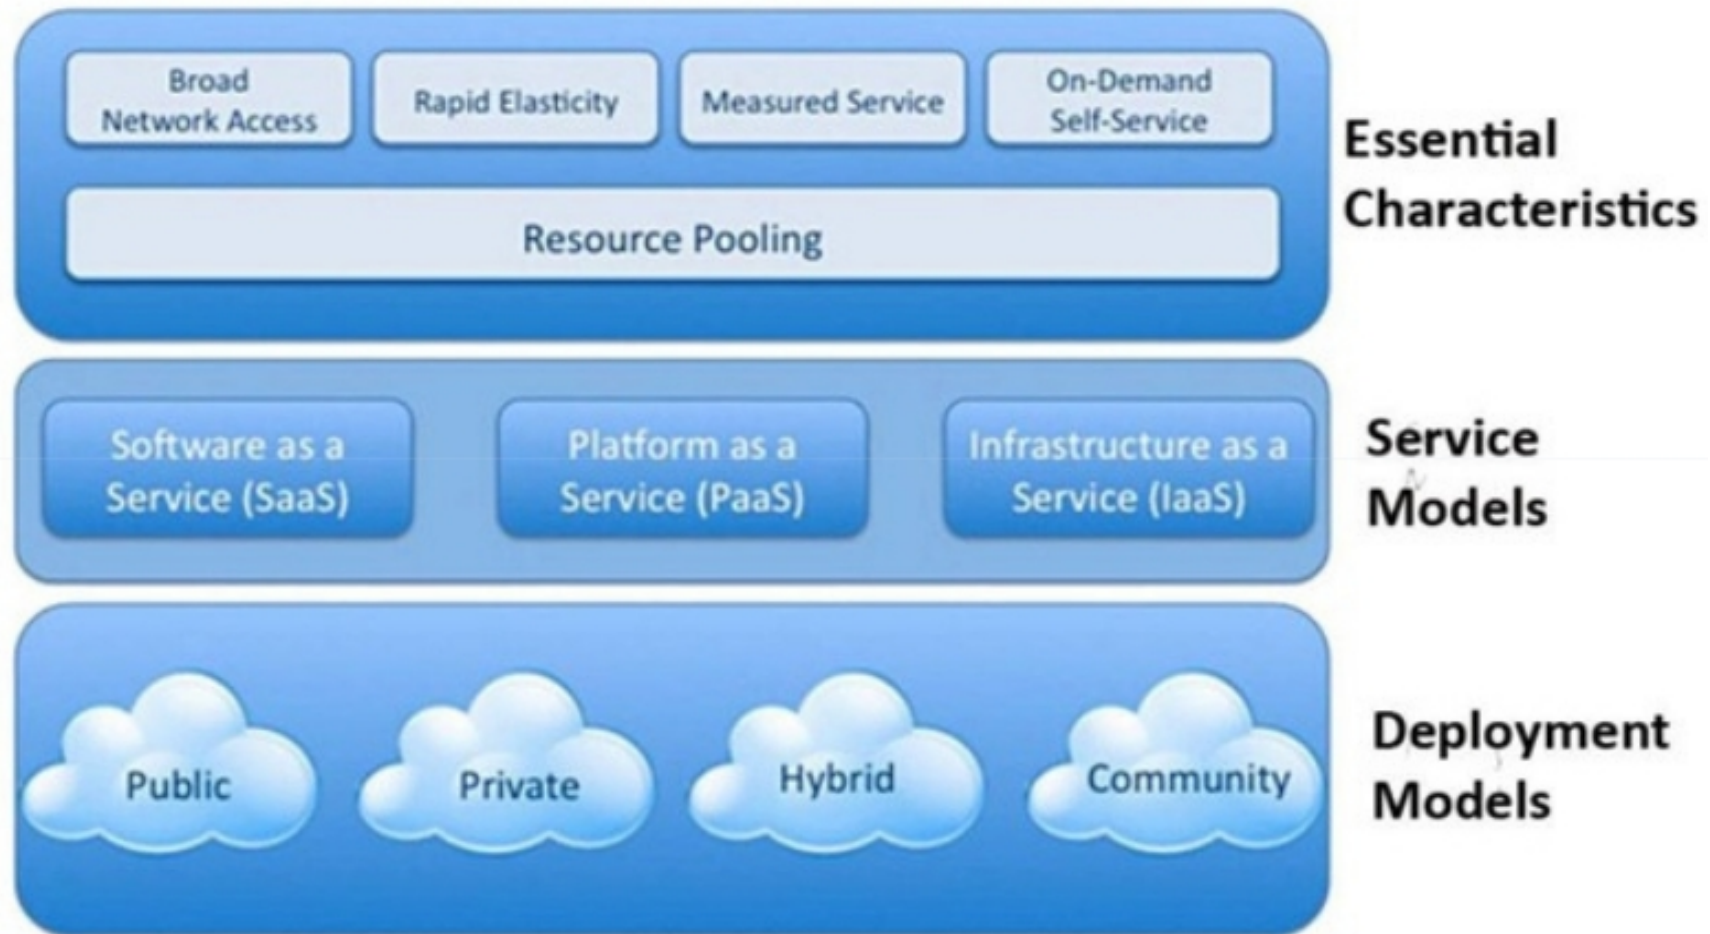

What is Cloud Computing ?

Cloud computing is a model for enabling ubiquitous, convenient, on-demand network access to a shared pool of configurable computing resources (e.g., networks, servers, storage, applications, and services) that can be rapidly provisioned and released with minimal management effort or service provider interaction.

The cloud model is mainly composed of

- * Five essential characteristics**
- * Three service models**
- * Four deployment models**

What is Cloud Computing ?

On Prem v/s Cloud

Why Cloud Computing ?

Businesses have become less skeptical of cloud computing, more confident in its security, and more inclined to invest money in it, according to new findings.

The cloud will continue to disrupt traditional IT models as the growing amount of data generated by people, machines, and things will increasingly be handled in the cloud.

Cloud computing promises new career opportunities for IT Professionals

Gartner predicts the worldwide public cloud service market will grow 18% in 2017 to \$248.8B up from existing \$208B by 2019

Cloud: Advantages/Disadvantages

Advantages:

- > Flexibility**
- > Availability**
- > Accessibility**
- > Multi-Tenancy**
- > Scalability**

Dis-Advantages :

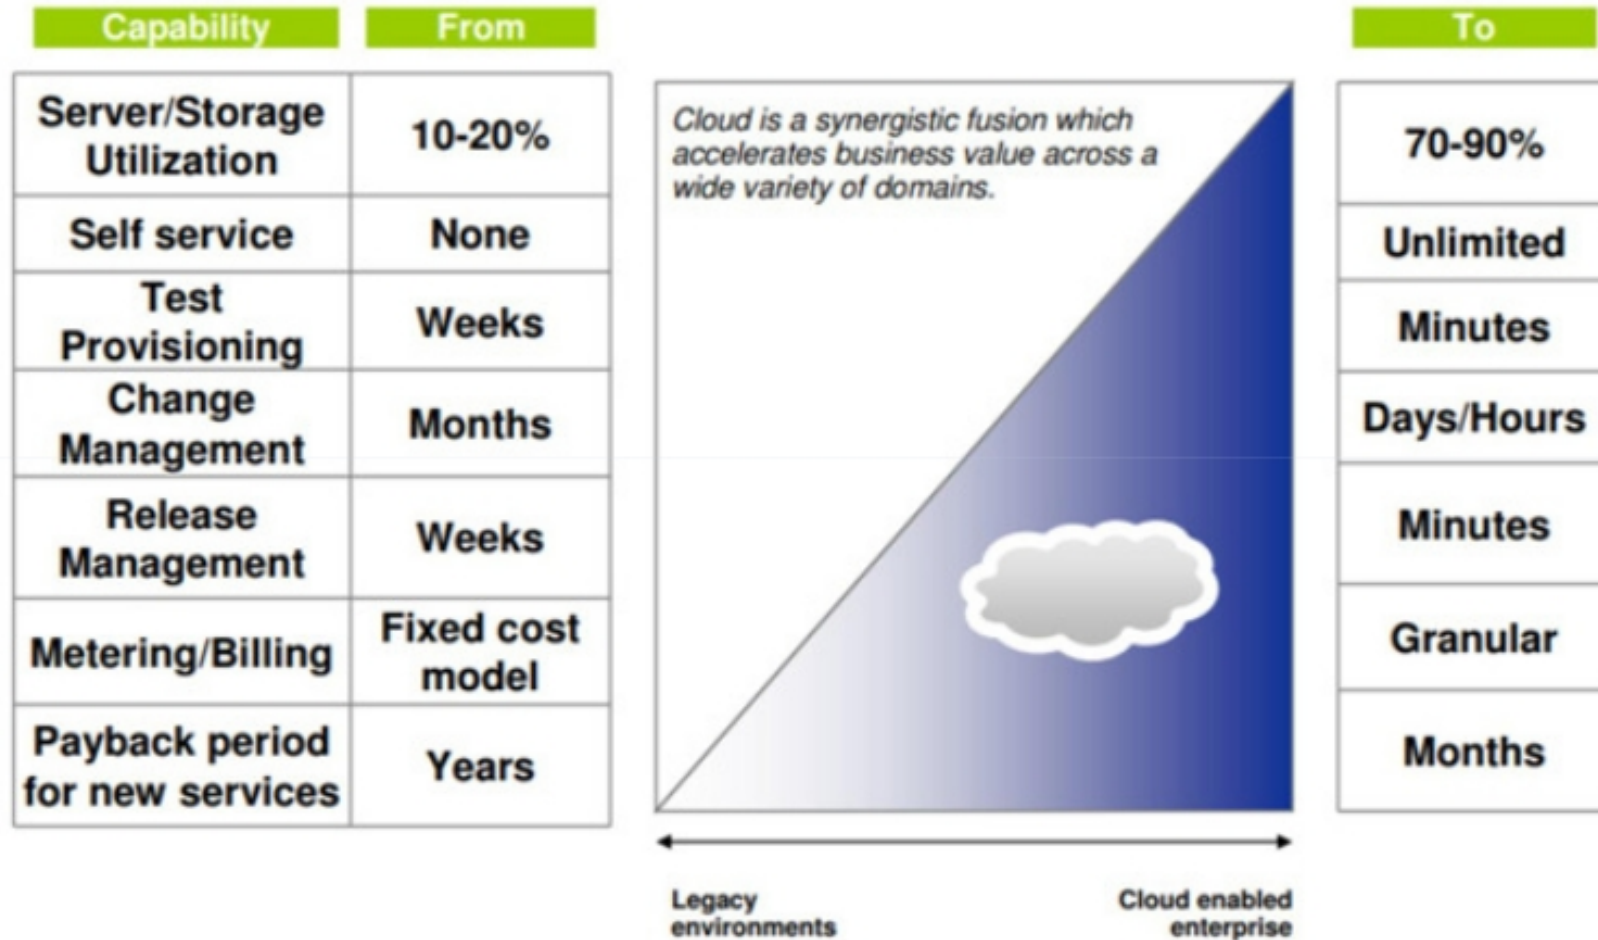

- > Security**
- > Vulnerability to attack**

Cloud Computing : Capacity v/s Usage

- Not enough capacity – dissatisfaction
- More capacity than needed – waste
- Capacity matches need – just right

Cloud: Difference

Cloud Provider
